

» The flexible, economic and approved alternative to Microsoft Server solutions! «

Univention Corporate Server

The flexible solution for today and the future

Univention Corporate Server (UCS) is a high performing and easy-to-use solution for the operation of servers – irrespective of whether they are flexibly applicable working group servers, high-performance authentication systems or complex server networks for system virtualization. Thanks to its flexible and solid architecture, UCS is ideal for use in small companies and in organisations with thousands of users.

The integrated UCS management system, which employs state-of-the-art web technologies, is optimised for the central administration of classic servers and use on the cloud. However, it also connects cloud-based services with classic IT and as such allows the flexible and efficient application of modern IT offers.

UCS combines tried-and-tested Open Source software into a consistently elaborated solution and is a very economic alternative to its competition. UCS supports the use of PCs based on Microsoft-

Windows, Linux or Mac OSX and a range of mobile end devices.

Tried-and-tested in practice

UCS is based on an enterprise Linux operating system which has been successfully in use on thousands of servers in companies, institutions, research facilities and schools of all sizes for years and guarantees a high degree of operational reliability and flexibility.

Simple to administrate

The UCS management system allows the simple administration of computers, networks, users and rights – even cross-location and cross-application. However, UCS is not just a server and management system, it also includes comprehensive functions for virtualization and for the integration of cloud-based services. In this way, UCS allows the use of state-of-the-art technology, whereby the UCS components are ideally coordinated to each other.

All Univention products are 100% Open Source software. This and easy-to-use, open interfaces for integration with other software guarantee a maximum of flexibility, efficiency and long-term reliability.

Univention – for the secure future of your company

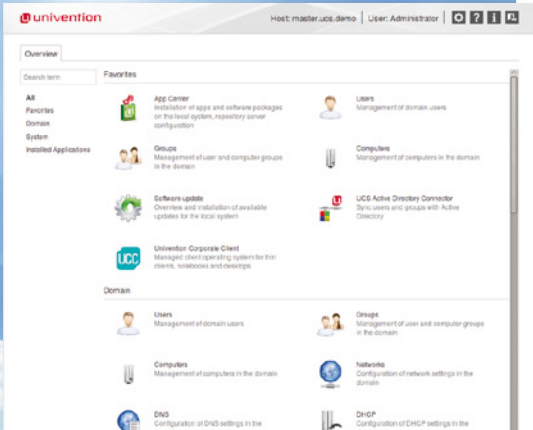

Univention is a leading European provider of Open Source products for the cost-efficient operation and effective administration of IT infrastructures with hundreds of satisfied customers from private industry and the public sector. An extensive network of partners guarantees optimal support wherever you are.

Function overview –
Univention Management Console

Cooperations with renowned software and hardware manufacturers allow UCS to create certified and ready-to-use complete solutions. Thanks to the integrated "App Center", a whole range of additional software solutions from Univention and third parties can be installed and run at the touch of a mouse. This reduces complexity and avoids unnecessary costs and risks.

Put to the acid test: for your security.

In UCS you receive a complete tested system. We guarantee projectable and regular updates. This reduces the risks for your IT operation, ensures failsafe performance and guarantees a reliable infrastructure.

/ Unique management system

- » The Univention Management System is the universally accessible »head-quarters« for the administration of your IT infrastructure, the users accessing it and their rights.
- » Even in demanding environments with a range of external sites or with applications operated by different cloud providers, for example, it ensures that all the components work together seamlessly and every user has access to the information he requires for his work.

/ Directory and basic services

- » UCS offers extensive Microsoft Active Directory-compatible functions and is thus an ideal platform for the operation of clients with Microsoft Windows, without the need for an additional Microsoft server operating system. Existing Active Directory environments can be easily integrated and can be replaced with UCS if required.
- » Scalable file services allow the provision of central file archives and targeted user and rights management.

- » The UCS printer services allow server-supported print cycles and facilitate the administration of printer drivers.
- » A high-performance network management system avoids unnecessary complexity without restricting the necessary flexibility.

/ Virtualization

- » UCS includes high-performance virtualization technologies and convenient functions for the central administration of virtualized systems. These can be operated with Microsoft Windows or Linux.
- » The consolidation of systems on a few servers that this makes possible reduces costs for energy, hardware and administration while increases flexibility and availability.

/ Client and workstation administration

- » UCS is the ideal platform for the organisation-wide management of end devices (PCs, notebooks thin clients or tablets) – irrespective of with which operating system these are operated. UCS supports Microsoft Windows, Mac OSX and Linux as

well as a variety of mobile devices based on iOS and Android.

/ Integral solution for classic IT and the cloud

- » UCS is equally optimised for operation with classic servers and on the cloud and combines these two versions of IT provision with its integral, easy-to-operate management system. In this way, UCS allows the seamless use of cloud-based services and secures long-term flexibility, independence and data security. Even in organisations which operate their existing infrastructure with other solutions.

/ Automatic monitoring and alarms

- » UCS includes ready-to-use, preconfigured functions for the fully automatic monitoring of all the important components, so that actions can be taken immediately if problems arise, often even before user productivity is restricted.
